

INNOZL™ coolant nozzles for grinding applications

KNOLL
.It works

Issue 10-2021

Features

Correct and needs-based supply of cooling lubricant reduces the required flow rate

Targeted cooling lubricant jet through optimal flow channel geometry improves cooling, lubrication and chip removal

Benefits

- Lower pump capacity required
- Lower cooling capacity required
- Smaller cooling lubricant system possible
- Prevention of grinding burn
- Longer life of grinding disc
- Higher productivity
- Lower grinding costs
- Lower power consumption of spindles

Areas of application

INNOZL™ coolant nozzles are designed for precision grinding and for stable series production. They are suitable both for the original equipment of new machines and for the retrofit of existing machines.

Description

INNOZL™ coolant nozzles

- prevent grinding burn by delivering the cooling lubricant directly to the contact zone at the same flow rate and speed
- are made of titanium with additive manufacturing process
- are equipped with internal flow channel geometry which keeps the flow velocity and direction constant for complex and high-quality grinding processes
- are examined in a flow analysis across the entire nozzle width for consistent cooling lubricant discharge
- are very compact and can be mounted as a single-piece accessory on existing machine cooling systems

Type designation code

INNOZL™ SL 38-75-25-5-2,0TI

Standard nozzles INNOZL™ SL

Available from stock.

INNOZL™ SL 14

Length 56 mm, outlet \varnothing 1.6 mm,
Widths 5, 8, 10, 12, 15, 20 mm

Available from stock.

INNOZL™ SL 38

Length 75 mm, outlet \varnothing 2.0 mm,
Widths 15, 20, 25, 30, 40, 50, 60, 80, 100 mm

Special nozzles INNOZL™ CL

Planning, design and manufacture of customised coolant nozzles according to customer requirements.

INMOZL™

Adapter joint hoses made of stainless steel

- airtight
- exact positioning of the cooling lubricant nozzle
- kink-proof
- wear-resistant
- vibration-proof

Service

Identify challenges in your grinding process before problems arise. We support you with process mapping and on-site consulting. As a result, we provide you with a specially designed coolant nozzle for your grinding process for the optimised supply of the cooling lubricant to the machining point. The objectives include assurance of the product quality by avoiding thermal damage to your components, an increase in productivity and a reduction of the cooling lubricant and energy consumption.
